

# Understanding the Interconnectivity between Intersection Traffic Congestion, and Outdoor Air Quality for Smart Cities

Authors: Kourtney Arena, Nasir Brown, Richard Cabrera-Felix, Dana Liberi, Da Ra Ly, Anthony Mackin, Jagadish Torlapati, Parth Bhavsar, Yusuf Mehta

## INTRODUCTION

Traffic emissions continue to be a prevalent source of air pollution worldwide. Those in high traffic urban areas are at higher risk for repository health problems. Stopped traffic allows for higher concentrated emissions at intersections. Table 1 shows pollutants of concern in ambient air pollution. Polycyclic Aromatic Hydrocarbons (PAHs) deposited on PM particles are of particular concern due to their relation to a variety of health problems. We developed a traffic model to study an intersection in Camden, NJ

Table 1. Pollutants and regulatory limits

| Pollutant         | Regulation                                 | Health Concern   |
|-------------------|--|--|
| PM <sub>2.5</sub> | 12 µg/m <sup>3</sup> 24-hr                 | aggravation of cardiopulmonary diseases <sup>3</sup>             |
| PM <sub>10</sub>  | 150 µg/m <sup>3</sup> 24-hr                |  |
| NO <sub>2</sub>   | 100 mg/m <sup>3</sup> 1-hr                 | respiratory diseases, and the development of asthma <sup>4</sup> |
| PAHs              | 0.1 mg/m <sup>3</sup> 10-hr mean for B(a)P | cardiopulmonary disease and various cancers <sup>1,2</sup>       |

## METHODS

Vissim model was created for the intersection of Haddon Ave & Dr. M. L. King Jr Blvd, Camden, NJ using the traffic count and classification data, lane geometry, and traffic signal timing. The model was used to predict traffic volumes for 1-2 pm, 2-3pm and Avg. Peak Hour during March and April.

**Case 1:** Baseline volume was determined from NJDOT 48 Hour Traffic Count Data for Haddon Ave, Dr. M. L. King Jr Blvd, & N 7<sup>th</sup> St.

**Case 2:** Traffic controls were removed to simulate free flow conditions.

**Case 3:** Vehicle input was doubled for future conditions

Link length, volume, (a) Satellite Map (b) Vissim Model avg. speed, and source type fraction from Vissim was input into MOVES3 to find emissions. **Dr. M. L. King Jr Blvd**

## DISCUSSION

- PM<sub>2.5</sub> and PM<sub>10</sub> slightly higher in April
- Generally increased emissions correlated to increase in link traffic volume

### Case 1 to Case 2

- 18 to 24% decrease in PM<sub>2.5</sub> & PM<sub>10</sub>
- 5% decrease in No<sub>x</sub> for 1-2pm & 2-3pm
- 0.1% decrease in No<sub>x</sub> for Peak hour

### Case 1 to Case 3

- 31 to 59% increase in PM<sub>2.5</sub> & PM<sub>10</sub>
- 33 to 59% increase in NO<sub>x</sub>

| Month        | Case | PM <sub>2.5</sub> (g/hr) | PM <sub>10</sub> (g/hr) | No <sub>x</sub> (g/hr) |
|--------------|------|--------------------------|-------------------------|------------------------|
| March 1-2 pm | 1    | 0.852                    | 0.948                   | 36.582                 |
|              | 2    | 0.648                    | 0.726                   | 34.674                 |
|              | 3    | 1.350                    | 1.512                   | 58.308                 |
| April 1-2 pm | 1    | 0.864                    | 0.966                   | 36.912                 |
|              | 2    | 0.660                    | 0.738                   | 34.968                 |
|              | 3    | 1.374                    | 1.536                   | 39.582                 |
| March 2-3 pm | 1    | 0.706                    | 0.882                   | 34.656                 |
|              | 2    | 0.606                    | 0.678                   | 32.712                 |
|              | 3    | 1.176                    | 1.314                   | 53.094                 |
| April 2-3 pm | 1    | 0.804                    | 0.894                   | 33.000                 |
|              | 2    | 0.618                    | 0.690                   | 31.29                  |
|              | 3    | 1.194                    | 1.338                   | 50.544                 |
| March Peak   | 1    | 0.954                    | 1.068                   | 41.598                 |
|              | 2    | 0.78                     | 0.87                    | 41.574                 |
|              | 3    | 1.254                    | 1.404                   | 55.404                 |
| April Peak   | 1    | 0.972                    | 1.086                   | 41.964                 |
|              | 2    | 0.792                    | 0.888                   | 41.922                 |
|              | 3    | 1.272                    | 1.428                   | 55.884                 |

## ONGOING STUDIES

- Complete the chemical analysis for PAH concentrations
- Find correlation between PM and PAH emission
- Simulate emissions model using AERMOD with Vissim data and compare emissions output to the MOVES3 output
- Apply the model to other intersections in NJ
- Use the model to help city planners reduce emissions at intersections
